## Overview

Campbell Scientific's CS451 and CS456 submersible pressure transducers provide reliable, accurate pressure and temperature measurements. Their rugged construction makes them suitable for water level measurements in canals, wells, ponds, harbors, lakes, streams and tanks.

These transducers consist of a piezoresistive sensor and a temperature sensor housed in a metal case. The CS451 has a 316L stainless-steel case that can be submerged in most canals, wells, ponds, lakes, and streams. The CS456 has a rugged titanium case that allows it to be used in saltwater or other harsh environments.

## Benefits and Features

- › Output acceptable for recording devices with SDI-12 or RS-232 capability including Campbell Scientific dataloggers.
- › Static accuracies of  $\pm 0.1\%$  full-scale range and  $\pm 0.05\%$  full-scale range<sup>1</sup> available. Accuracies are over 0° to 60°C range.
- › Quality construction that ensures product reliability.
- › Rugged stainless steel or titanium case that protects piezoresistive sensor.
- › Fully temperature compensated.
- › Simultaneous 50/60 Hz rejection.
- › Low power sleep state between measurements that reduces power consumption.
- › Weighted nose cone option available for easier submersion. Adds 0.211 kg (0.465 lb) to the transducer's weight.
- › NPT nose cone option available for closed-pipe applications.

## Technical Details

Both transducers output either a digital SDI-12 or RS-232 signal to indicate observed pressure and temperature. This output is acceptable for recording devices with SDI-12 or RS-232 capability including Campbell Scientific dataloggers.

The CS451 and CS456 are fitted with a rugged Hytrel cable that remains flexible, even under harsh environmental conditions. The cable incorporates a vent tube to compensate for atmospheric pressure fluctuations. The vent tube terminates inside a desiccant tube, which prevents water vapor from entering the inner cavity of the transducer.
